Alkaline protease derived from Bacillus production and use thereof

The present invention is directed to a novel alkaline protease preparation having enhanced oxidation stability, to a method for the preparation thereof, and to 5 its use as an additive for cleaning agents. Typical cleaning agents are detergent compositions for laundering.

#### BACKGROUND OF THE INVENTION

Proteolytic enzymes produced by cultivation of members of the genus <a href="Bacillus">Bacillus</a> in suitable nutrient media are 10 widely used in detergent compositions. Examples of such commercial protease products are ALCALASE, ESPERASE and SAVINASE (these are registered trade marks), all supplied by NOVO Industri A/S, Denmark. These exhibit adequate storage stability in the presence of the usual components of 15 detergent compositions, such as sequestering agents, surfactants and even bleaching agents of the peroxy type, provided that they are suitably protected from their physical environment in the detergent composition, for example by

- their incorporation into suitably coated particles.

  However, in the laundering process where the solubilized enzyme is exposed to the same agents in solution, stability may become critical in the sense that the enzyme is prone to destruction prior to the completion of its intended stain-removing action, particularly at elevated temperatures
- 25 in the presence of bleaching agents of the peroxy type, such as percarbonate, perborate, and persulfate salts. Since all <u>Bacillus</u>-derived proteases known in the art exhibit an appreciable instability at laundering temperatures exceeding 50°C in the presence of a peroxy compound it is often
- 30 recommended to prolong the washing programme by including a holding time at lower temperature when detergent protease compositions are used.

Attempts to enhance the stability of <a href="Bacillus"><u>Bacillus</u></a> derived serine proteases towards oxidizing agents by applying the technique of site specific mutation to the corresponding genes is known in the art, e.g. from European Patent

- 5 Publication Nc. 0 130 756 which discloses stabilized subtilisins by substituting the methionine residue next to the active-site-serine residue with amino acid residues which are less prone to oxidation. However, the obstacles associated with the adaption of recombinant DNA strategies to
- 10 large scale manufacturing processes are well-known, the most frequent cnes being instability of the engineered microorganism through loss of genetic material and lower yields compared with those obtained from the wild strain or its conventional mutants.
- As far as the inventors hereof are aware the prior art is silent about non-engineered <u>Bacillus</u> derived serine proteases exhibiting an enhanced stability towards oxidation as compared with commercial <u>Bacillus</u> proteases.
- The object of the present invention is to overcome 20 the above-mentioned instability problems encountered with the Bacillus-derived alkaline protease preparations known heretofore. According to the invention this object has been met in that it has surprisingly been found that a number of Bacillus strains belonging to what is presently defined as
- 25 the same novel species produce alkaline protease which exhibits a remarkably enhanced stability towards bleaching agents of the peroxy type conventionally used for laundering. Normally, the alkaline protease produced by the novel Bacillus species of this invention will contain three
- 30 main constituent, mutually distinguishable alkaline proteases (herein designated A, B and C) often in proportions, measured in protease activity units, of roughly one third of each. However, variant strains may lack the capability of producing at least one of these constituent proteases. Fortuitously,
- 35 all three constituent proteases show similar detergency and stability characteristics.

#### SUMMARY OF THE INVENTION

Thus, according to its first aspect the present invention provides a protease preparation comprising alkaline protease derived from a novel alkalophilic <u>Bacillus</u> species 5 defined by the strains NCIB 12286 and NCIB 12289 which alkaline protease retains a residual activity measured in Casein Protease Units (CPU, <u>vide infra</u>) after 30 minutes at pH 9.5 in a solution of 1.75 g/l of sodium tripolyphospate (STPP), 1.0 g/l of sodium perborate and 0.1 g/l of

10 tetraacetylethylenediamine (TAED) of at least 80% and 60% at temperatures of 40°C and 50°C, respectively, of the residual activity at 25°C in the absence of sodium perborate and TAED.

Another aspect of the present invention provides a protease preparation comprising at least 10% by activity in 15 CPU of a constituent protease A which is improper and the constituent protease A which is improved the constituent of the constituent and the constituent of the consti

- 15 CPU of a constituent protease A which is immunochemically identical to the protease identified by the position of peak A in fig. 1 of the accompanying drawings and has the following additional characteristics: a molecular weight of about 41.5 kD, an isoelectric point of about 9.3, a specific
- 20 activity of at least 150 Anson Units and 250 Hemoglobin Protease Units (AU and HPU, respectively, <u>vide infra</u>) per gm of protein, and a residual activity measured in CPU after 30 minutes at pH 9.5 in a solution of sodium tripolyphosphate (STPF, 1.75 g/l), sodium perborate (1.0 g/l), and
- 25 tetraacetylethylenedlamine (TAED, 0.1 g/l) of at least 80% and 60% of temperatures of 40°C and 50°C, respectively, of the residual activity at 25°C in the absence of sodium perborate and TAED.
- In a preferred embodiment the protease preparation 30 is essentially devoid of proteases B and C, identified by peak B of fig. 1 and by peak C of fig. 1 and 2, respectively.

In yet another preferred embodiment of the invention the balance of the protease activity is provided jointly by said proteases B and C or singly by either of

35 them. Immunochemically, proteases B and C are identical to

each other and different from protease A. Protease B and C have molecular weights of about 28.5 and 31 kD and isoelectric points of about 8.8 and 5.2, respectively.

The present invention further provides a protease 5 preparation comprising essentially said protease E.

In addition, the present invention is directed to a protease preparation comprising essentially said protease C.

According to a further aspect of this invention there is provided a method for producing a protease

- 10 preparation, which process is characterized by cultivating a strain of the novel  $\underline{\mathtt{Bacillus}}$  species defined by the strains NCIB 12288 and NCIB 12289 under aerobic conditions in a nutrient medium containing assimilable sources of carbon, nitrogen, and phosphorus, preferably followed by recovery of 15 the protease preparation from the fermentation broth.

In a preferred embodiment of producing the protease preparation the fermentation is conducted with a strain of the  $\underline{\text{Bacillus}}$  species defined above, which strain is mutated so as to essentially block its capability of synthesizing one

20 or two of the constituent proteases whilst maintaining its capability of producing the remaining constituent protease or proteases.

In another preferred mode of producing the protease preparation the fermentation is conducted with a  $\underline{\mathtt{Bacillus}}$ 

25 strain selected from the group consisting of NCIB 12288, NCIB 12289, NCIB 12512 and NCIB 12513.

According to yet another aspect there is provided a cleaning agent containing an effective amount, preferably at least 0.1 AU, more preferred from 0.5 to 10 AU, of the

30 protease preparation of this invention per 100  $\ensuremath{\text{g}}$  of cleaning agent. The cleaning agent may be a powder or a liquid wherein the protease preparation is protected, for example by incorporation into granules or as a suspension in a hydrophobic medium.

#### BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 shows the elution chromatogram of the protease preparation derived from NCIB 12289 on a CM Sepharose® CL 6B column, subsequent to gel filtration on 5 Sephadex® G 25.

Fig. 2 shows affinity chromatography of protease  ${\it C}$  on a bacitracin column.

Figs. 3 and 4 are exemplary of the pH-activity and temperature-activity curves, respectively, of the protease 10 preparation of this invention, all protease components exhibiting similar temperature- and pH-activity

Figs. 5 and 6 illustrate the results of comparative washing experiments conducted with the protease preparation 15 of this invention and ALCALASE using two different detergents. Experimental conditions are given in Example 5 hereinafter.

Fig. 7 illustrates the results of washing experiments conducted with each of the constituent proteases.

#### 20 DETAILED DESCRIPTION OF THE INVENTION

# The microorganism, taxonomy, morphology, biochemical reactions

#### The microorganism:

characteristics.

The microorganisms productive of the alkaline

25 protease of the present invention were isolated essentially by the method for the selection of alkalophilic <u>Bacilli</u> described in British Patent No. 1,243,784. They will not grow on ordinary media for <u>Bacillus</u> strains unless these are supplemented by either 0.1 M carbonate buffer, pH 9.0 - 9.7

30 or a 7 - 10% (w/v) solution of NaCl, the 0.1 M carbonate

buffer, pH 9.0 being the preferred supplement. Two cultures

have been deposited with The National Collection of Industrial Bacteria (NCIE), Torry Research Station, Aberdeen, United Kingdom for the purposes of patent procedure on the date indicated below. NCIE, being an international depository authorized under the Eudapest Treaty of 1977, affords permanence of the deposit and accessability thereto by the public in accordance with Rules 9 and 11, respectively, of the above treaty.

#### Taxonomy:

Medium TY was used for taxonomic investigations which were conducted according to the methods of Ruth Gordon et al. (The Genus Bacillus, Agriculture Handbook no. 427, U.S.D.A. 1973)

Composition of medium TY:

20 Trypticase 20 g
Yeast extract 5 g
FeCl<sub>3</sub>.6H<sub>2</sub>O 7 me
MnCl<sub>2</sub>.4H<sub>2</sub>O 1 me
MgSO<sub>4</sub>.7H<sub>2</sub>O 15 g
25 distilled H<sub>2</sub>O to 1000 ml

pH adjusted to 7.3 with KOH before autoclaving for 15 min at  $121^{\circ}\mathrm{C}$  .

Liquid media for the determination of the production of acid from carbohydrates were supplemented with 10% NaCl before autoclaving.

Solid media were supplemented with 2% agar before 5 autoclaving and sterile carbonate buffer pH 9.0 was aseptically added to a final concentration of 0.1 M just before pouring the slants.

The microorganisms of this invention are aerobic, spore forming bacteria belonging to the genus Bacillus.

0 Morphology: Vegetative roos with a diameter of 0.6 - 0.8 micron, length 1.2 - 3 micron.

Spores: Central to subterminal, oval, not swelling the sporangia.

| 25  | Hydrolysis of tyrosine                                | 4          | +          |
|     | Deamination of phenylalanine                          | _          |            |
|     | Reduction of nitrate to nitrite                       | -          | _          |
|     | Acid from glucose                                     | +          | +          |
|     | Acid from sucrose                                     | +          | +          |
|     | Acid from xylose                                      | +          | _          |
|     | Acid from mannitol                                    | (+)        | (+)        |

None of the strains NCIE 12288 and NCIE 12285 produced acid from arabinose, mannose, melibiose, raffinose, or sorbitol.

Optimal growth conditions are 30 - 37°C, pH 9.0. The above taxonomic results show that the two strains do not belone to any previously described species, but should be considered to define a novel Bacillus species. 5 Taxonómic data for strains NCIB 12:12 and NCIB 12513 are very similar to the above, indicating that all four strains belong

# Assay for proteolytic activity

### OPA-Casein method

- 10 Proteolytic activity is determined with casein as the substrate. One Casein Protease Unit (CPU) is defined as the amount of enzyme liberating 1 millimole of primary amino groups (determined by comparison with a serine standard) per minute under standard conditions, i.e. indubation for 30 -15 minutes at 25°C and pH 9.5.
  - A 2% (w/v) solution of casein (Hammarsten, supplied by Merck A.G., West Germany) is prepared with the Universal Buffer described by Britton and Robinson (Journ.Chem.Soc.  $\underline{1931}$ , p. 1451), adjusted to pH-9.5.
- 20 Two ml of substrate solution is preincubated in a water bath for 10 minutes at 25°C. 3 ml of enzyme solution containing b g/ml of enzyme preparation, corresponding to about 0.2 - 0.3 CPU/ml of Britton-Robinson buffer (pH 9.5), is added. After 30 minutes of incubation at 25°C the reaction
- 25 is terminated by the addition of a stopping agent (5 ml of a solution containing trichloroacetic acid (17.9 g), sodium acetate (29.9 g), and acetic acid (19.8 g), filled up to 500  $\,$ ml with deionized water). A blank is prepared in the same manner as the test solution, except that the stopping agent 30 is added prior to the enzyme solution.

The reaction mixtures are kept for 20 minutes in the water bath, whereupon they are filtered through  ${\tt Whatman}^{\odot}$  Primary amino groups are determined by their colour development with  $\underline{o}\text{-phthaldialdehyde}$  (OPA).

Disodium tetraborate decanydrate (7.62 g) and sodium dodecylsulfate (2.0 g) is dissolved in 150 ml of 5 water. OPA (160 mg) dissolved in 4 ml of methanol is then added together with 400 µl of beta-mercaptoethanol, whereafter the solution is made up to 200 ml with water.

To the OPA reagent (3 ml) is added 400 µl of the above-mentioned filtrates with mixing. The optical density 10 (OD) at 340 nm is measured after about 5 minutes.

The OPA test is also performed with a serine standard containing 10 mg of serine in 100 ml of Britton-Robinson buffer (pH 9.5). The buffer is used as a blank.

The protease activity is calculated from the

15 optical density measurements by means of the following formula:

CPU/ml of enzyme solution = 
$$\frac{(OD_t - QD_b) \times C_{ser} \times C}{(OC_{ser} - QD_b) \times MW_{ser} \times C}$$

20 CPU/g of enzyme preparation = CPU/ml: b

wherein OD $_{\rm t}$ , OD $_{\rm p}$ , OD $_{\rm ser}$  and OD $_{\rm E}$  is the optical density of the test solution, blank, serine standard, and buffer, respectively, C $_{\rm ser}$  the concentration of serine in mg/ml in the standard, MW $_{\rm ser}$  the molecular weight of serine. O is the dilution factor (in this instance equal to 8) for the enzyme solution, and  $t_{\rm j}$  is the incubation time in minutes.

#### OPA-hemoglobin method

Proteolytic activity is determined with ureadenatured hemoglobin as the substrate. One Hemoglobin
30 Protease Unit (HPU) is defined as the amount of enzyme liberating 1 millimole of primary amino groups (determined by

comparison with a serine standard) per minute under standard conditions, i.e. incubation for 30 minutes at 25°C and pH 9.5.

A 2% (w/v) solution of urea-denatured hemoglobin is 5 perpared with 0.2 M borate buffer, adjusted to pH 9.5.

Two ml of substrate solution is preincubated in a water bath for 10 minutes at  $25\,^{\circ}$ C. 1 ml of enzyme solution containing b g/ml of enzyme preparation, corresponding to about 0.7 - 0.3 HPU/ml of borate buffer, is added.

10 Incubation, termination of the reaction and determination of primary amino grups by means of the OPA reagent are the same as those described above for the OPA-casein method.

The OPA test is also performed with a serine standard containing 10 mg of serine in 100 ml of the borate 15 buffer, the buffer itself serving as a blank.

The protease activity in HPU is calculated from a formula identical to that used in the OPA-casein method.

# Modified Anson-hemoglobin method

- In the Anson-hemoglobin method for the 20 determination of proteolytic acitivty, denatured hemoglobin is digested under standard conditions. The undigested hemoglobin is precipitated with trichloroacetic acid (TCA) and the amount of TCA soluble product is determined with Folin-Clocalteu phenol reagent.
- One Anson Unit (AU) is the amount of enzyme which under standard reaction conditions digests hemoglobin at such an initial rate that there is liberated per minute an amount of TCA soluble product which gives the same colour with phenol reagent as one milliequivalent of tyrosine.
- 30 The standard reaction conditions are the following: Temperature 25°C; reaction time 10 min.; pH 7.5.

For further reference, see M.L. Anson, Journal of General Physiology vol. 22 (1939), pp. 79-89; O. Folin and V. Ciocalteu, The Journal of Biological Chemistry vol. 73

Different values for proteolytic activity will invariably be obtained depending on the choice of analytical method. While the OPA-casein assay is convenient for monitoring proteolytic activity for laboratory and production 5 purposes, it may be said that proteolytic activity towards a porphyrin containing substrate, such as hemoglobin, is more relevant for assessing the utility of a detergent protease because of the generally experienced difficulties with

removal of stains from blood and chlorophyll. A high specific 10 activity of a detergent procease towards porphyrin containing substrates is desirable.

#### The protease preparation

The <u>Bacillus</u> strains productive of the protease of this invention are cultivated under aerobic conditions in a 15 nutrient medium containing assimilable carbon and nitrogen . together with other essential nutrients, the medium being composed in accordance with the principles of the known art. Suitable carbon sources are carbohydrates, such as sucrose, glucose and starch, or carbohydrate containing 20 materials such as coordinates.

- 20 materials such as cereal grains, malt, rice and sorghum. Polysaccharides are usually at least partially converted into fermentable sugars by suitable hydrolyzing enzymes prior to the fermentation process. The carbohydrate concentration incorporated in the medium may vary widely, e.g. up to 25%
- 25 and down to 1 5%, but usually 5 15% will be suitable, the percentages being calculated as equivalents of glucose.

The nitrogen source in the nutrient medium may be of inorganic and/or organic nature. Suitable inorganic nitrogen sources are nitrates and ammonium salts. Among the

30 organic nitrogen sources quite a number are regularly used in fermentation processes involving the cultivation of bacteria. Illustrative examples are soybean meal, cotton seed meal, peanut meal, casein, corn steep liquor, yeast extract, urea, and albumin. In addition, the nutrient medium should also 35 contain the usual trace substances.

The optimum temperature for propagation of the  $\frac{\text{Bacillus}}{\text{Bacillus}}$  strains and for their production of protease is routinely ascertained by the skilled artisan. The cultivation may be conducted in the temperature range of from 25°C to

- 5 35°C, preferably at alkaline pH values. The latter may be obtained by addition of suitable buffers, such as sodium carbonate or mixtures of sodium carbonate and sodium bicarbonate after sterilization of the growth medium. For cultivation in tank fermentors it is necessary to use
- 10 artificial aeration. The rate of aeration is similar to that used in conventional tank fermentation.

After fermentation, liquid enzyme concentrates may be produced by removal of coarse material from the broth and, if desired, concentration by evaporation at low temperature or by reverse osmosis. Figure 1972-1973-1974

15 or by reverse osmosis. Finally, perservatives may be added to the concentrate.

Solid enzyme preparations may be prepared from the purified and/or concentrated broth by precipitation with salts, such as Na<sub>2</sub>SO<sub>4</sub> or with water miscible solvents, such 20 as ethanol or acetone; removal of the water in the broth by suitable drying methods such as spray-drying may also be employed.

The proteolytic activity of the protease preparation so obtained is usually in the range of from 0.1 25 to 10 CPU/g.

The pH-activity and temperature-activity curves of protease according to this invention are shown in fig. 1 and 2. The sample used was that prepared in example 1 below, and activity was determined by the CPU method described above,

30 except that pH or temperature was changed. The curves show that optimum pH with casein as substrate is about 6 to 11, and that optimum temperature for 30 minutes reaction is about  $50-60^{\circ}$ C.

#### Purification of Constituent Proteases

The first, second and third protease (hereinafter referred to as protease A, Protease B and protease C, respectively) may be separated and purified by separation 5 techniques generally known by the skilled artisan.

An initial purification of the crude protease may be effected by dissolution, e.g. in a suitable buffer, followed by protein precipitation, e.g. with a salt, such as  $(NH_4)_2SO_4$ , or a water-miscible organic solvent, for example 10 acetons.

Further purification of the recovered precipitate is usually attained by chromatographic methods, for example including gel filtration in a buffer system as the initial step. Protease containing fractions of the eluate may be located by monitoring U.V. absorbancy and/or by determining

· the protease activity.

Following gel filtration further purification is usually achieved by ion exchange chromatography, for example on a SEPHADEX® anion or cation exchanger, whereby at least 20 partial resolution of the constituent proteases may be effected, by using suitable buffer-salt-gradient systems. Rechromatography of peak material therefrom by means of the same or a different ion exchanger usually affords the protease species in a sufficiently pure state. If required, further purification of the individual proteases may be achieved by subjecting them to affinity chromatography, for example on a bacitracin column.

Purification of the constituent proteases is conveniently monitored by gel electrophoresis, for example in 30 a polyacrylamide gel (PAGE) with or without sodium dodecylbenzenesulphonate (SDS). Autodigestion of the proteases may be prevented by active site blocking prior to electrophoresis, for example with phenylmethylsulphonyl fluoride (PMSF).

35 SDS-PAGE and isoelectric focusing (IEF) in the presence of marker proteins are convenient means for molecular weight (MW) and isoelectric point (pI) determinations, respectively. According to these methods, proteases A, B and C have molecular weights of about 41.5, 28.5 and 31.0 kD, and isoelectric points of about 9.3, 9.2 and 5.2, respectively. Protease A is further characterized by specific activities per gram of protein of about 180 AU/g and 270 HPU/g.

# Immunochemical Characterization

Monospecific antisera against each of the purified proteases may be raised for example by immunizing rabbits

10 according to the regimen described by N. Axelsen et al. in: A manual of Quantitative Immunoelectrophoresis, Blackwell Scientific Publications, 1973, chapter 25. Purified immunoglobulins may be obtained from the antisera, for example by salt precipitation ((NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>), followed by

15 dialysis and ion exchange chromatography, e.g. on DEAE-

Immunochemical characterization of proteins is usually conducted either by Ouchterlony double-diffusion analysis (O. Ouchterlony in: Handbook of Experimental

- 20 Immunology (D.M. Weir, Ed.), Blackwell Scientific Publications, 1967, pp. 655-706) or by crossed immunoelectrophoresis (N. Axelsen et al., <u>supra</u>, chapters 3 and 4).
- Proteases B and C of the invention show

  immunochemical identity to each other, and both show nonidentity to protease A. Proteases A, B and C of the invention
  all show immunochemical non-identity to the following known
  alkaline Bacillus proteases:
- Alcalase (product of Novo Industri A/S, Denmark), derived from <a href="mailto:Bacillus licheniformis">Bacillus licheniformis</a>, with Subtilisin Carlsberg as the active component.

- Savinase and Esperase (products of Novo Industri A/S), prepared from alkalophilic <u>Bacillus</u> <u>sp.</u> according to US 3,723,250.
- API-21 (U.S. patent 4,480,037).
- 5 The protease of Danish patent application No. DK 87/0544.

#### Cleaning agent

Cleaning agent according to the invention is typically a laundry detergent in liquid or powder form. In the case of a liquid detergent, the stability of the protease during storage may be unsatisfactory, and it is therefore preferred to include enzyme stabilizers in the formulation. Thus, the liquid formulation may include polyols such as 1,2-propanediol (propylene glycol), typically 1 - 20%. Optionally, the formulation may include boric acid (or laternatively, boric oxide, borax or a borak), typically up to 10%. Also optionally, formate or a salt of other lower fatty acid may be included, e.g. in an amount up to 10%. The calcium content in the liquid detergent may be from 0.001 to 0.1% (all % es by weight).

#### 20 Example 1

## Protease preparation derived from strain NCIB 12289

Cells of <u>Bacillus</u> strain NCIB 12289 were harvested after 2 days' incubation at 30°C from slants of TY-agar supplemented aseptically with 0.1 M carbonate buffer pH 9.0 and 1% skim milk. The cells were transferred to 500 ml baffled shake flasks containing 100 ml BP-X medium + 0.1 M carbonate buffer pH 9.0.

5

Medium BP-X:

| potato starch  | _     |
|--|-------|
| barley flour   | 100 g |
| soy bean flour                                       | 50 g  |
| Na-caseinate   | 20 g  |
| Na <sub>2</sub> HPO <sub>4</sub> .12H <sub>2</sub> O | 10 g  |
| TERMAMYLE 60L (NOVO)                                 | 9 g   |
| PLURONIC TM (NOVO)                                   | 0.1 g |
| tap water to lea                                     | 0.1 g |

tap water to 1000 ml

10 The mixture was slowly heated from 60°C to 85°C during 30 minutes with agitation in order to liquefy the starch. The mixture was then heated quickly and kept above 95°C for 10 minutes before it was cooled, distributed into the shake flasks and autoclaved for 40 minutes at 121°C. 15

The inoculated shake flasks were incubated for 4 days at 25°C on a rotary shaker at 240 rpm. The fermentation broth (2.5 1, 54 CPU/1, as assayed by the OPA-casein method) was centrifuged for 30 minutes at 4000 rpm. The centrifuged liquid (2.0 l) was concentrated to 1.0 l by ultrafiltration

20 on a Mini-lab module from DDS, RO-Division, Denmark. After the concentration it was weshed with 5.0  $\!\!1$  of 0.01 molar sodium borate, pH 9.0, and finally concentrated further to 400 ml. It was then lyophilized, giving 25.5 g of crude preparation with an activity of 3.0 CPU/g. Yield: 57%.

#### Example 2

## Separation of constituent proteases A, B and C

Fermentation with NCIE 12289 was performed essentially as in Example 1. The culture broth (75 AU/kg) was purified through the following steps:

- flocculation
- centrifugation
- evaporation
- blank filtration
- salt precipitation with Na<sub>2</sub>SO<sub>4</sub>
  - redissolution
  - blank filtration
  - sterile filtration
  - concentration by ultrafiltration and washing
- 15 lyophilization

The lyophilized crude preparation (activity 15.3  $\dot{\text{CPU/g}}$  or 24.5  $\dot{\text{AU/g}}$ ) was purified and separated into constituent proteases by the following sequence of steps.

#### 1. Redissolution

20 2.5 g of protease was dissolved in 50 ml of the following buffer:

dimethylglutaric acid 0.01  ${\tt M}$ 

boric acid 0.1 M

calcium chloride 0.002 M

sodium hydroxide to pH 7.0

#### Centrifugation

. The redissolved protease was centrifuged at 18000 rpm at 25 - 30°C for 20 minutes.

25

#### 3. Filtration

The supernatant was filtered on Whatman glassfilter type GF/F, 42 ml of clarified protease solution was collected.

# 5 4. Gelfiltration of Sephacex G 25 medium

40 ml of clarified protease solution was applicated to a G 25 column (5 cm0 x 22.6 cm) equilibrated with the buffer used in step 1. 10 ml fractions were collected, with a flow rate of 3.3 ml/min., and tested for activity. Fractions 10 19 - 25, comprising 54% of the applicated activity, were pooled, diluted to 100 ml and filtered on Millipore 0.45 µ

# 5. lon exchance chromatography on CM Sepharose CL 6B

- The filtered eluate was applicated on a CM

  15 Sepharose CL 6E column (5 cmØ x 7.8 cm) equilibrated with the buffer used in step 1. Protease C and colored substances were washed out of the column with the same buffer. The other components were eluted with a 0 0.05 M NaCl gradient in 2 1 of the same buffer. 10 ml fractions were collected, with a
- 20 flow rate of 3.3 ml/min., and monitored by UV-absorbance. The gradient was started after fraction 37. The UV-absorbing fractions 5 40 and 71 150 were tested for protease activity. The protease activity was found in 3 distinctive peaks, as seen in fig. 1.

Fractions 76 - 98, comprising 25.3% of the applicated activity, were pooled and designated Protease A.

Practions 122 - 140, comprising 23.7% of the 30 applicated activity, were pooled and designated Protease B.

# 6. Affinity chromatography on a bacitracin column

The column (1.6 cm0 x 12 cm) was equilibrated with the buffer of step 1. The pool of fractions 9 - 25 were applicated on the column. The protease was eluted with the 5 same buffer with added NaCl (1 M) and isopropanol (25%). The flow rate was 5 ml/min. and the fraction size 10 ml. The elution diagram is shown in fig. 2 (OD at 280 nm vs. time). Fractions 24 - 27 comprising 73% of the applicated protease activity, were pooled and designated Protease C.

#### 10 Example 3

## Protease preparation derived from strain NCIB 12286

The same procedure as in Example 1 above was followed for the cultivation of strain NGIF 12288. The fermentation broth (0.3 1, 35 CPU/1) gave 11.7 g of crude 15 preparation with an activity of 0.39 CPU/g. Yield: 43%.

#### Example 4

## Protease preparation derived from strain NCIB 12512

The same procedure as in Example 1 above was followed for the cultivation of strain NCIE 12512. The 20 fermentation broth (1.8 1, 30 CPU/1) gave 19.1 g of crude preparation with an activity of 1.0 CPU/g. Yield: 35%.

#### Example 5

# Protease preparation derived from strain NCIB 1251:

The same procedure as in Example 1 above was followed for the cultivation of strain NCIE 12513. The 5 resulting preparation was separated as in Example 2 above and was found to be devoid of protease B.

#### Example 6

# Stability of Bacillus proteases in solutions of STPP, sodium perborate and TAED

- Solutions, each with an activity of 0.2 CPU per litre of the protease and containing 1.75 g/l of sodium tripcly phosphate (STPP), 1.0 g/l of sodium perborate and 0.1 g/l of tetraacetyl- ethylenediamine (TAED) were incubated for 30 minutes at 40°C and 50°C. The residual activity was then
- 15 measured according to the OPA-casein method, the activity after incubation at 25°C in the absence of sodium perborate and TAED being calculated as 100%. The results are presented in the following table:

| 20<br>Protease  | after 30 min                                   | dual activity utes at                                |

#### Example 7

# Washing Trials with Crude Protease Preparation

Washing tests were performed in a Terg-O-tometer (as described in Jay C. Harris: "Detergency Evaluation and 5 Testing", Interscience Publishers Ltd. (1954), p. 60-61)at an agitation rate of 100 rpm for 10 minutes at 60°C with EMPA 116 test fabric swatches, 5 cm x 10 cm (cotton soiled with blood, milk, and carbon black), supplied by Eidgenössische Materialprüfungs- und Versuchsanstalt, Sankt Gallen,

10 Switzerland. The following detergent compositions A and B were used in water of 9° German Hardness:

|     |                  | Detorget                              |                     |
|-----|------------------|---------------------------------------|---------------------|
|     | LAS              | Detergent A (g/l)<br>1.0              | Detergent B $(g/1)$ |
|     | Soap             |                                       | 1.0                 |
| 1 4 | STPP             | 0.1                                   | 0.1                 |
| 1.  |                  | 1.25                                  | 1.25                |
|     | Sodium silicate  | 0.25                                  | 0.25                |
|     | Sodium sulphate  | 2,4                                   |                     |
|     | Sodium perborate | none                                  | 2.4                 |
|     | TAED             | · · · · · · · · · · · · · · · · · · · | 1.0                 |
| 20  | pH               | none                                  | 0.1                 |
|     | P1-              | 9.5                                   | 9.5                 |

#### wherein

LAS is linear alkylsulfonate (NANSA 805, produced by Albright & Wilson)

STPP is sodium tripolyphosphate

25 TAED is tetraacetylethylenediamine.

The cloth to liquid ratio was 9 swatches per 900 ml of detergent solution. The detergent enzymes used were the enzyme preparation of Example 1 and ALCALASE protease, both at dosage levels of 0.05, 0.1 and 0.5 CPU/1.

The results of duplicate washing tests with detergents A and B are shown in Fig. 5 and 6, respectively, wherein the washing efficiency is expressed as medium values

of % Remission as determined by remission photometry by using a ZEISS ELREPHO photometer at 460 nm. The figure shows that the washing effect of the protease of this invention at dosage levels of about 0.05 CPU/l and above exceeds that of the ALCALASE protease both in the absence (Detergent A) and presence (Detergent B) of perborate + TAED.

#### Example 8

# Washing trials with constituent proteases A, B and C

Washing tests were preformed in a Terg-O-tometer at 10 100 rpm for 10 min at 50°C. The following detergent composition was used in water of 9° German hardness:

|    | ·LAS             | 0.4 g/1              |
|----|------------------|----------------------|
|    | AE ·             | 0.15 g/1             |
|    | Soap             | 0.15 g/1             |
| 15 | STPF             | 1.75 g/1             |
|    | Sodium silicate  | 0.4 g/i              |
|    | CMC              | 0.05 g/1             |
|    | EDTA             | 0.03 g/1<br>0.01 g/1 |
| 20 | Sodium sulphate  |                      |
|    | Sodium perborate | 5/ 4                 |
|    | TAED             | 1.0 g/l              |
|    | Ħq               | 0.1 g/l              |
|    | • *              | 9.5                  |

wherein

LAS, STPP and TAED are as in Example 7.

25 AE is alcohol ethoxylate (Berol 065, produced by Berol Kemi AB, Sweden).

Clean swatches consisted of white cotton textile, which was desized with amylase (BAN Novo), dried and cut in-pieces (10 x 20 cm).

Clean swatches were immersed in spinach juice, squeezed between two rollers and dried in a tumbler at  $60\,^{\circ}\text{C}$ . This was repeated twice to obtain soiled swatches.

The cloth to liquid ratio was 8 swatches (4 clean 5 and 4 soiled) in 800 ml of detergent solution. Protease A, B and C from Example 2 were tested at dosages of 0.1, 0.5 and 1.0 CPU/l. The results are shown in fig. 7 as %. Remission at 460 nm versus protease dosage.

The figure shows that all three constituent 10 proteases have a good washing effect in detergent with perborate at  $50^{\circ}\text{C}$ .

TEA stands for triethanolamine, DTPA for pentasodium salt of diethylene-triamine-pentaacetate, DG for

25 sodium diglycolate, MPG for mono-propylene glycol, AES for
alcohol-ethoxy sulphate (Dobanol 25-3S/60, product of Shell),
LAS for linear alkyl-benzene sulphonate (Nansa 1169P), and AE
stands for alcohol ehtoxylate (Berol 160, product of Berol
Kemi AB, Sweden). In each case, the ingredients in fraction I

30 and II were mixed, and then fraction II was added slowly to
fraction I while stirring

The water content (including water contained in other ingredients) was about 41% w/w in all detergents.

The following protease preparations were tested:

- The lyophilized crude preparation of Example 2, dissolved in a mixture of water and MPG (1:1 by weight) and diluted to an activity of 2.5 AU/g.
- Alcalase 2.5L (product of Novo Industri A/S, Denmark), a commercial liquid preparation of alkaline protease from Bacillus licheniformis.
- 16 Esperase 8.0L (product of Novo Industri A/S, Denmark), a commercial liquid preparation of alkaline <u>Bacillus</u> protease prepared according to US 3,723,250.

The calcium content of each protease preparation was adjusted to 1.0% w/w (as Ca<sup>++</sup>) by addition of CaCl<sub>2</sub>,

15 2H<sub>2</sub>C. In each experiment, 1% w/w of a protease preparation (after Ca<sup>++</sup> adjustment) was added to one of the above detergents, the mixture was incubated at 50°C, and samples were taken after 0, 23, 47 and 134 hours incubation. The protease activity of each sample was determined, and the

20 results are shown below, expressed as residual activity in % of initial activity (i.e. activity after 0 days). pH was measured after 0 and 134 hours

pH was nearly constant in all experiments. It is 20 seen that protease of the invention is more stable than Esperase and Alcalase in all the detergent formulations tested. The results further show that borate and MPG are very effective as stabilizers for protease of the invention in liquid detergents.

#### CLAIMS

- l. A protease preparation comprising alkaline protease derived from a novel alkalophilic <u>Bacillus</u> species defined by the strains NCIB 12288 and NCIB 12289 which 5 alkaline protease retains a residual activity measured in Casein Protease Units (CPU) after 30 minutes at pH 9.5 in a solution of 1.75 g/l of sodium tripolyphospate (STPP), 1.0 g/l of sodium perborate and 0.1 g/l of
- tetraacetylethylenediamine (TAED) of at least 80% and 60% at 10 temperatures of 40°C and 50°C, respectively, of the residual activity at 25°C in the absence of sodium perborate and TAED.
  - 2. A protease preparation comprising at least 10% by activity in CPU of a constituent protease A which is immunochemically identical to the protease identified by the
- 15 position of peak A in fig. 1 of the accompanying drawings and has the following additional characteristics: a molecular weight of about 41.5 kD, an isoelectric point of about 9.3, a specific activity of at least 150 Anson Units and 250 Hemoglobin Protease Units (AU and HPU, respectively) per gm
- 20 of protein, and a residual activity measured in CPU after 30 minutes at pH 9.5 in a solution of sodium tripolyphosphate (STPP, 1.75 g/l), sodium perborate (1.0 g/l), and tetraacetylethylenediamine (TAED, 0.1 g/l) of at least 80% and 60% of temperatures of 40°C and 50°C, respectively, of
- 25 the residual activity at 25°C in the absence of sodium perborate and TAED.
  - 3. The protease preparation of claim 2 which is essentially devoid of other proteases than said first protease  $\lambda$ .
- 4. The protease preparation of claim 2, wherein the balance of the protease activity is provided jointly by proteases B and C or singly by either of these, said proteases being identified by peak B of fig. 1 and by peak C of fig. 1 and 2, by molecular weights of about 28.5 and 31.0
- 35 kD by isoelectric points of about 8.8 and 5.2, respectively, said proteases B and C being immunochemically identical to each other, but different from said protease A.

- $\mbox{5. A protease preparation comprising essentially said protease $B$. }$
- $\ensuremath{\text{6.\ A}}$  protease preparation comprising essentially said protease C.
- 7. A method for producing a protease preparation, which process is characterized by cultivating a strain of the novel <u>Bacillus</u> species defined by the strains NCIB 12288 and NCIB 12289 under aerobic conditions in a nutrient medium containing assimilable sources of carbon, nitrogen, and
- 10 phosphorus, preferably followed by recovery of the protease preparation from the fermentation broth.
  - 8. The method of claim 7, wherein the fermentation is conducted with a strain of the <u>Bacillus</u> species defined above, which strain is mutated so as to essentially block its
- 15 capability of synthesizing one or two of the constituent proteases whilst maintaining its capability of producing the remaining constituent protease or proteases.
- 9. The method of claim 7, wherein the fermentation is conducted with a <u>Bacillus</u> strain selected from the group 20 consisting of NCIB 12288, NCIB 12289, JP 75 and JP 170.
- 10. A cleaning agent containing an effective amount, preferably at least 0.1 AU, more preferred from 0.5 to 10 AU, of the protease preparation of any one of the claims 1 to 6 and/or protease preparation produced by the 25 method of any one of the claims 7 to 9.
